	End user	
Front-end Site		
	This will not be a normal web app, this will be run on a screen and open in the browser and the browser is running in full screen.	
	Intro Video	When someone has not touched the screen, it will start playing on loop across the entire screen. It can be a video, or a beautiful scenic view, or a kiosk again on its own. The kiosk is designed to run with it.

	Map	After the intro animation completes, the heart of the entire kiosk experience is the map of the venue or location. On this map, users can view the venue or location. On this map, users can view the venue or location.
	Project Deployment

Kiosk Web app	
pecific device and running on it, The HTML file is already screen kiosk mode.	
The visitor cannot see any browser address bar, no tabs, no taskbar, nothing. Just the screen.	
ned the screen, then the kiosk is in its idle state. A video is tire screen. This could be a welcome video, a brand promotional deo related to the venue. It just keeps playing over and over essentially waiting patiently for someone to walk up and interact	
Any person who is watching this screen sees the looping video on the big screen. Maybe they read the words on screen that say something like "Touch anywhere to begin" or "Tap to explore." They become curious and they reach out and tap the screen anywhere	
The moment the visitor taps the screen, the idle looping video stops immediately. The kiosk wakes up.	

Right after the tap, a short cinematic intro animation begins. This is not a loading screen. This is intentional and designed to feel premium. It could be the venue logo appearing, This animation lasts about 2 to 3 seconds and then automatically transitions forward without the visitor needing to do anything.	
Deletes, the interactive map smoothly appears on screen. This is the experience. The visitor can now see a full screen map of the map there are 8 specific points of interest marked clearly.	
Each of those 8 points is represented by a some icon, Each icon also has a label underneath it so the visitor knows what each location represents	
At the top of the screen there is a simple instruction text telling the visitor to tap a location to explore. At the bottom of the screen a countdown timer is quietly running, counting down from 120 seconds.	
The visitor looks at the map and reads the location names. They decide which place they want to learn more about. They tap on that specific icon on the map.	
The moment the visitor taps an icon, the video for that location plays immediately. There is no loading spinner, no black screen, no delay at all.	
The video plays full screen and shows the visitor everything about that location. It could be a walkthrough tour, a highlight reel, or an informational video about that specific place. The visitor watches and gets all the information they need.	
When the visitor is done watching the video, or if they want to go back and explore another location, they simply tap anywhere on the video screen. There is no specific back button they need to find. Any tap on the screen anywhere works.	
The kiosk is smart enough to know when nobody is interacting with it. From the moment the visitor stopped touching the screen, a 120-second countdown was running silently in the background. The countdown is visible at the bottom of the screen so if someone is still there they can see it.	
Every single time the visitor taps or touches the screen at any point, this timer resets back to 120 seconds automatically. So as long as someone is actively using the kiosk the timer keeps resetting and nobody gets kicked out mid session.	
But once the visitor walks away and nobody touches the screen for a full 120 seconds, the timer reaches zero. The kiosk recognizes that the session is over.	
When the timer hits zero, the kiosk automatically shows a brief "Session Ended" message for just a moment and then it smoothly fades back to the idle looping video. No staff member needs to do anything. No one needs to press a reset button. The kiosk handles it completely on its own.	

This is an on-site physical installation on a dedicated touchscreen kiosk device. All project files including the HTML application file and all video assets will be transferred directly onto the kiosk device via USB drive or remote desktop access. Google Chrome will be configured to run in full screen kiosk mode and the application will be set to launch automatically every time the device is powered on requiring zero technical knowledge from venue staff. The application runs completely offline with no internet connection required as all videos and content are stored locally on the device. Deployment covers one dedicated kiosk device only. Any additional devices will require separate deployment effort. Full on-site testing will be conducted after installation to verify all features work correctly on the physical touchscreen.
